

PROGRAMMING TEST

Using Angular 12 and all required libraries create an application which consumes statistical data from the following public API:

<https://github.com/M-Media-Group/Covid-19-API>

Acceptance criteria:

- Application has to be well designed. Use common components.
- Application has to be integrated with GitHub and allow to login only for GitHub users (OAuth).
 - Of course GitHub requires registration of the application, so app has to be configurable and the documentation has to be provided how to register app and start using.
- Once logged in, user has to have ability to request statistical data based on country:
 - the information regarding cases for the current moment:
 - confirmed
 - recovered
 - deaths
 - vaccinated level in % of total population
 - based on historical data should be shown:
 - new confirmed cases since last data available

Additional requirements:

- The code should follow good practices and have comments.
- It is a good practice to upload source code to the Github repo and provide us the link.
